

COMPOSITE RESINE FILLING
(White Dental Filling)

What is it?

Dental resins are aesthetic restorations of teeth, which can be used on damaged or decayed teeth in which the material used is precisely resin. This is worked to the color of the tooth, so the result is a cosmetic and pleasant restoration. During the procedure a base will be placed to protect the dental nerve.

Indications

Dental resins are indicated when the walls of the dental crown are intact. Cavity not so extensive and there is a symptomatology of discomfort to stimuli such as cold but which disappears quickly. In anterior teeth it can be used to fix small imperfections such as fractures or cavities.

They can also be used in certain cases where the patient wishes to remove his amalgam restorations. It should be taken into account that when a restoration of this type is removed, the vast majority of the time it has cavities underneath. Which probably requires endodontic treatment due to its proximity to the dental nerve. Followed by a dental reconstruction and a lab-fabricated crown.

Approximate time of the appointment

30 – 60 Minutes
